The dura of the anterior cranial fossa can be destroyed or eroded by a variety of pathological processes, including viral infections, tumors, and trauma. The use of cranial bone grafts is often effective for the repair of large skull base defects; however, this technique cannot be used for small defects and for defects involving the base of the skull. This article describes the various methods of reconstructing skull base defects, with special emphasis on the placement of a vault-type skull base implant for reconstruction of large or complex skull base defects. A sound reproduction engine is needed that can load and play all sound file types. It should be relatively small, robust, fast and cheap. It must be optimized for small samples. Any sample must be placed at the beginning of the sound file. Sounds should be loaded by position rather than by format. This means that at the end of the file you can still have a sample that has been removed. In this way the database and the engine can be independent. The engine must be able to load the sounds from any host or machine by writing them to disk. It must be able to play them back from disk. The sound engine is also responsible for manipulating the sound, so it must be able to manipulate pitch, pan, volume, EQ and the physical location of the sound. It must play both mono and stereo sound files. It must work on all sounds regardless of format, encoding, bit-rate, data type, length, etc. It must be self-contained - the user does not need to download any plug-ins or additional software. It should be multi-platform - able to run on Linux, Windows and OSX. The goal is to make a dedicated database/player engine that is affordable. As a sound engine is
