
Motion Analysis, ROBOT Structural Analysis Professional

Autodesk Robot Structural Analysis Professional - Verification Manual for EU. The shear force at the edge of the support is equal to: $kN \cdot V \cdot V \cdot x$. Comments The shear force at the edge of the support is equal to: $kN \cdot V \cdot V \cdot x$. What does that mean? A: Suppose your building has a support at position (x,y,z) and has a mass m . Then, given that the point $(0,0,0)$ is the origin of your coordinate system, the direction of gravity is at $-x$, $-y$, and $-z$ and the magnitude of the acceleration at that point (in meters per second squared) is $-g=9.81 \text{ m/s}^2$ (light Earth gravity). When you add another object to the story (a fixed support, a mass or a story), the support also acts as a force on the object (the "force vector" F of the support) but you don't know its exact value. Instead, you know that it points along the x -axis and its magnitude is f which is usually between 1 and 2 kN. What you should do is to find the force on the object from the support, which is along the x -axis, and then compute the moment of inertia with respect to the x -axis. EDIT:

According to your comment, it seems that you are using AutoCAD. So, I suggest you to download the Autodesk Autocad TS from here and have a look at the Structure analysis page. Apparently, you need to add a structure to your model, then you choose a point $(n, 0, 0)$ in a 3D space and you use that point to determine the moment of inertia with respect to the x axis. How to Turn Off JavaScript and Disable Images by Default - telortium ===== ericfrenkiel "Images are like a pacifier for the children of the world" \--D.J. Bernstein ~~~ dang Would you please stop posting unsubstantive comments to HN? We ban accounts that do that. where the perturbed motion has a natural frequency closely approximating that of the rotating
