You need to jump across gaps, and avoid falling off, to collect as many notes as you can before you reach the ground. As your block of glass is falling, you can click on the screen and rotate to point in any of four directions. Some notes can be collected by jumping over them, and some notes are essential to the game, as you will not be able to jump. If you are successful in collecting all the notes, you will survive. -- I've written most of this game myself, and it's available on the Apple App Store and Google Play. The game does require quite a lot of speed. It's especially difficult to jump fast enough if you are very close to the ground. The goal of the game is to collect as many notes as possible, but there is no time limit. The game will be over as soon as you run out of space. Solutions If you like the game, you can buy me an iTunes or Google Play gift card as a thank you. Or simply give me a few notes, and it's your decision if you'd rather give me something. The Fall You are blocks of glass. You can jump, and you can rotate to point in any of 4 directions. --- The Notes Each note is worth a certain number of points. When you jump over a note, the highest scoring note

Thanks for sharing. A: I had the same problem and I am still looking for a solution. Any ideas? I managed to find an app for my iOS which gives me access to my Google Drive like a file share from my Google drive. After giving the app read and write permission and importing it on my iOS device, I can see all my Google Drive files from my device. The only thing you have to do is to setup your Google account on your iOS device, add your file share

---

folder to it and it should work. Maybe it's not the best option but it helps a little, I hope it helps you too. Q: 'Websites' in Laravel I was just wondering about how you would get the 'website' in Laravel? Is it done using the built in HttpServerer? Or are we suppose to modify Laravel to add a parameter aswell? A: As you probably already know you can run everything in your laravel app through the Kernel class, the route. The Kernel class is used to run the application. This allows you to interact with the request (i.e. get variables, etc.) as well as create your own classes. So it's easy to add new classes. In your case you just need to add a route to your routes.php file (or manually add the route there in routes.php if you prefer). The route might look something like this:

```
Route::get('website//', array('as' =>
    'website.page', 'uses' =>
    'YourController@yourMethod'))
```

The year, month and year, month is for your site. As

---

long as you have a route of "website" then you can get the year/month using the route and get your year/month Then in your controller: public function yourMethod(\$year, \$month){ ... } Q: AWS EB Link: Assigning Environment Variables with Jenkins I've configured Jenkins to build a Docker image in AWS ElasticBeanstalk. I can build my image and then launch an instance of my image from within my Jenkins build using: eb start-instances --image \$DOCKER\_IMAGE --region \$AWS\_REGION However, how can I set some environment
